

Example for class definition made inside the class

```
#include <iostream>
using namespace std
class person
{
    char name [30];
    int age;
    void getdata (void)
    {
        cout << "Enter name: " << endl;
        cin >> name;
        cout << "Enter age: " << endl;
        cin >> age;
    }
    void display (void)
    {
        cout << "\n Name: " << name;
        cout << "\n Age: " << age;
    }
};

void main()
{
    person p;
    p.getdata();
    p.display
    p.display();
}
```

Output

Enter name : JOHN

Enter age : 25

Name : JOHN

Age : 25
